

BranchLedger User Manual

Company setup and daily operating procedures

Version 1.0 • 4 October 2026

Proposed system specification and operating procedures

BranchLedger supports daily accounting at the main branch and sub-branches, including offline entry and online synchronisation. Owners and general managers receive a clear company view with traceable financial records. This document defines intended behaviour for development and pilot validation. It does not certify an implemented product or statutory compliance.

Using this manual

This manual describes planned BranchLedger workflows. Screen labels are proposed and must be checked against the implemented pilot. It contains no fabricated screenshots. Use a demo company for training before entering live financial information.

Before first use, obtain your assigned account and branch, use a supported enrolled browser and device, and connect to the internet to install the offline application. Your administrator sets permissions and offline access limits. Never share accounts.

Company onboarding

1. Sign in as the owner or authorised setup administrator. 2. Open Company setup and enter company details. 3. Select a primary business category and any additional activities. 4. Add the main branch and sub-branches, assigning each category. 5. Choose reporting and transaction currencies. 6. Set financial year and accounts. 7. Import reviewed opening balances. 8. Invite users and assign branch permissions. 9. Set approvals and the designated offline writer. 10. Complete a demonstration trading day.

Imports: use the supplied field mapping, preview rows and resolve missing account, currency or supplier references. Have the accountant approve the balanced opening journal. Preserve the import batch reference. Do not submit the same source file as a new batch without reviewing duplicates.

Recording daily transactions

Sale: open Sales, select branch, customer if relevant, items or services, quantities, prices, currency and payment method. Review discounts and tax settings configured by your accountant. Save. Check the local confirmation and sync status. Credit sales create customer balances; later receipts settle the selected invoice.

Expense: open Expenses, choose category, date, amount, currency and payment account. Add the supplier or payee, explanation and receipt. Submit for approval when required. An approval request alone does not reduce confirmed cash or create a posted expense until the applicable posting workflow completes.

Purchase: select supplier and invoice reference, enter goods or services, quantity and cost, confirm receipt and record payment or credit terms. Returns must link to the original record where possible. Payment: select the supplier invoices or other approved obligation and record the actual payment account and reference.

Check saved records before re-entering a transaction after an uncertain result. Open the transaction list and search its reference. A saved Pending record remains available for sync; creating another entry may create a genuine manual duplicate.

Working offline and synchronising

Before going offline, confirm the application is installed, required forms and product lists are available, offline access is valid and the device has enough storage. Use the designated device for stock entry and cash closing.

While offline, record permitted tasks normally. A local confirmation means the record is on this device. It does not mean head office has received it. Central approvals and current company totals require a connection.

On reconnect, open Sync centre. Automatic synchronisation runs while the app is active; use Sync now if needed. Wait for acknowledgements, review Failed items and confirm the last successful sync time. Background processing is not guaranteed when the browser is closed.

Status	Meaning	Action
Pending	Saved locally and awaiting upload	Reconnect and run sync
Syncing	Upload or acknowledgement in progress	Keep the app open and avoid re-entry
Synced	Central system acknowledged this record	Check separate approval or posting state
Failed	Upload or validation needs attention	Open the reason and resolve or escalate

Do not clear browser storage, uninstall the app or change devices with pending records. Use the approved encrypted local backup process. If access expires or changes, reconnect and ask your manager to review retained records.

Daily closing and reconciliation

1. Check all daily sales, refunds, receipts and payments. 2. Review pending or failed entries. 3. Count physical cash by currency. 4. Enter the cash count and confirm expected cash based on opening float, receipts, payments and transfers. 5. Explain differences. 6. Submit the close for approval. 7. Synchronise and confirm the manager receives it.

Cash differences remain visible and do not disappear through editing totals. Bank reconciliation compares recorded movements with a bank statement: match references and amounts, investigate unmatched entries, and submit authorised adjustments. A closed period requires an authorised correction procedure.

Stock and branch transfers

Grocery: receive products, count stock, record sales quantities and log damaged or expired goods with reasons.

Restaurant: maintain recipe quantities and versions, receive ingredients, record menu quantities and record actual waste. Expected ingredient use does not replace physical stock counts.

Money transfer: choose receiving branch, amount, currency and payment account; submit and obtain sender approval. The receiving branch confirms the actual receipt. Stock transfer: select products and quantities, confirm dispatch and then receipt. Report shortages against the transfer rather than recording unrelated entries.

An unreceived transfer remains in transit. Internal transfers do not count as company sales. Never use the transfer workflow for unrelated companies without the approved intercompany process.

Owner and general manager dashboard

Open Manager overview and select All branches or a particular branch. Choose Today, This week, This month or a custom period. Read the reporting currency and freshness indicator before comparing figures.

Cards show sales, expenses, profit and balances. Branch bars show performance comparisons. Trend lines show movement over time. Expense breakdowns show where spending occurs. Click a figure or bar to inspect the records behind it.

Check delayed branch updates, cash differences, overdue debts and pending approvals. Open each alert for its reason and next action. A branch with no recent sync may have unreported activity; zero displayed sales must not automatically be interpreted as zero actual sales.

Revenue includes posted sales under the configured accounting rules. Gross profit deducts cost of sales. Net profit also reflects operating expenses and other relevant entries. Cash balances show money available and differ from profit.

Approvals corrections and reports

Approver: inspect the source details, receipt, amount, currency and branch. Approve or reject within your delegated limit and provide a reason. Escalate requests outside your authority. Decisions reach offline staff after synchronisation.

Correction: edit an unposted draft when authorised. For a posted record, request a linked reversal or adjustment with a reason. Never delete or overwrite the original posting. Ask the accountant when a period is locked.

Reports: choose Reports, select type, branch and date range, review completeness and export PDF or Excel. For a company report, check that every expected branch appears and internal transfers are handled correctly. Limit exported financial information to authorised recipients.

Troubleshooting and recovery

Problem	Safe next step
Cannot sync	Check connectivity and session, retry, then inspect the error
Possible duplicate invoice	Compare supplier, reference and original documents
Stock conflict	Pause disputed posting and ask the manager to reconcile
Dashboard differs from branch	Compare filters, currency, posting state and last sync
Storage warning	Back up pending records and ask support before clearing anything
Lost device	Report immediately, revoke access and restore approved backups
Forgotten password	Use account recovery while online
App update available	Save work, back up pending data and follow the update prompt

For support, supply branch, device, operation ID, time and error message. Never send passwords, secret keys or unnecessary customer information. The support channel and operating hours are configured at launch.

Before a restore, an authorised administrator records the recovery point, restores into an isolated environment and reconciles counts and balances. Recover local records through the approved import process, retaining original operation IDs to avoid duplication.

Daily staff checklist

At opening: confirm branch and currency, opening cash, offline readiness and sync status. During trading: save each record, retain source documents and check errors. At closing: reconcile receipts and payments, count cash, explain differences, submit the close and confirm sync. Before leaving: lock the device and protect any pending records.

BranchLedger launch safeguards update

Version 1.1 addendum | 4 October 2026. This addendum forms part of this PDF and updates the original requirements wherever they differ. Repeated checks have been merged. Items 1 to 39 cover technical launch controls, 40 to 49 cover presentation and customer information, and 50 adds the requested temporary account-lockout control.

All controls are required for implementation or verification, not reported as completed. No application source code or deployed service was supplied for this update. The PDFs therefore do not prove that BranchLedger is secure, free of defects or ready for launch. Retain the original accounting, offline and branch requirements.

Safe sign in and account recovery

Use your individual account and stronger authentication when required. Repeated failed logins may temporarily delay or lock sign-in; use the approved recovery route or contact your administrator. Account recovery displays a generic response to protect account identities. Reset links expire and can only be used once. Request a new link when necessary.

After a password change, previous online sessions must end. Reconnect enrolled offline devices to refresh access. Preserve pending local records and ask an authorised manager to review any records rejected after an access change. Never share reset links or passwords with support.

Loading errors timeouts and safe retry

Loading means work is in progress. An empty view should explain whether there are no matching records, delayed sync or restricted access. A timeout does not prove the operation failed: search its reference and sync status before creating a new record. Retry the existing operation so its original ID is preserved.

If usage is limited, follow the displayed retry time. Pending records stay on the device. Do not repeatedly click Save or pay again after an uncertain result. For uncertain payments, inspect the payment state and ask support to reconcile the provider record.

Receipts imports and payments

Upload only the types and sizes shown by the system. A rejected upload may need a permitted format, smaller file or a clean scan. Keep the original evidence; compression must not make receipt text unreadable. Do not rename an executable to look like a receipt.

Review prices, currency and authorised discounts before saving. The server verifies prices and permissions. A payment is confirmed by the verified provider process and reconciliation, not by a screenshot or browser redirect. A repeated webhook must not create a second payment.

Administrator operating checklist

Before launch, verify rate limits, temporary lockout recovery, session revocation, reset expiry, upload rejection, duplicate subscriptions and payments, tenant isolation and backup restoration. Confirm the privacy and terms pages describe the actual service. Review monitoring alerts and budget caps, assign escalation owners and retain test evidence.

At closing, inspect failed sync items, cash differences and unresolved payment states. During an incident, record branch, operation ID, time and safe error details. Do not send passwords, tokens

or unnecessary customer records. Security and application logs must be accessible only to authorised reviewers.

Presentation and customer information

Use genuine authorised reviews and verifiable metrics. Demo charts must say they are examples. Use a readable logo, favicon, consistent labelled icons and an accessible colour palette. Publish working privacy and terms links and use the intended production domain with HTTPS. A text logo, particular punctuation or hosting provider name is not itself a security defect.

Optional AI

AI is optional and disabled until reviewed. When enabled, usage limits apply. Verify its suggestions against source records; AI output must not automatically change financial records, approvals or permissions.
